Slot: A

Course Name: Data Handling and Visualization

Course Faculty: Dr S Senthilvadivu

Project Title: Design of a Fashion Retail Trend and Seasonal Demand Visualization Platform

Module Photographs:

Project Description:

The project, “Design of a Fashion Retail Trend and Seasonal Demand Visualization Platform,” focuses on analyzing fashion sales and customer demand. It helps identify popular fashion trends and understand how product demand changes across different seasons. The platform presents the analyzed data through simple visualizations, making it easy for retailers to understand trends and make better decisions.

My Contribution-Module 1: Fashion Sales Data Wrangling & Category Tagging

This module focuses on collecting, cleaning, and organizing fashion sales data. It handles missing, duplicate, and incorrect data to improve data quality. The products are grouped into categories such as dresses, shirts, footwear, and accessories. Proper category tagging makes the data easier to analyze and compare. The prepared data is then used for identifying fashion trends and seasonal demand.
